SENTRY

HACKWEEK 2026

IDENTITY HACKATHON

PROJECT REPORT

BUILD / INNOVATE / IDENTIFY

Perplexity	For database resource research and task organization.	We structured the actual SQL schema based on the research, manually organized the learning routes into the database entities, and verified data integrity across the platform.
Claude	To set up the Spring Boot project and learn the essential syntax and workflow for making a RESTful API in Spring Boot Java.	We implemented the business logic, configured the controllers and services to match our specific domain models, mapped the endpoints, and tested the API functionality.
Claude	Learning User Authentication and setting up a JWT filter on website login.	We integrated the JWT filter into our specific Spring Security configuration, securely managed our secret keys, and verified the end-to-end authentication flow.
Google Gemini	For complex debugging and workflow planning.	We applied the debugging suggestions directly to the codebase, executed the planned workflows, and thoroughly tested the application to ensure bugs were resolved correctly.
Lovable.ai	For prototyping the frontend.	We manually refined the exported React components, connected them to our custom backend APIs, adjusted the routing, and finalized the Vite/CSS configurations for deployment.

Declaration: I/We confirm that this entry is our own work, that every AI tool used is listed above, and that I/we can explain every part of the submitted code.
