SkillQuest

Problem Statement

When attempting to learn a new skill, people often face the frustration of scattered, unstructured, and overwhelming resources. A significant amount of time is wasted trying to figure out what to learn and in what order, rather than actually practicing the skill.

Our Idea

To address the hackathon theme **'One Frustration Fixed'**, we created SkillQuest. SkillQuest is a web platform designed to organize a skill learning route in one centralized place. It provides users with curated task lists tailored to specific skills, giving them a clear, step-by-step roadmap to achieve mastery without the hassle of building a curriculum from scratch.

Development Journey

Developed by Aniket Yadav and Anurag Bhati, the journey of building SkillQuest involved a full-stack approach leveraging modern tools and AI assistance.

Category	Tools & Technologies	Focus Area
Frontend	React	Rapid UI prototyping & responsive design
Backend	Java, Spring Boot,	RESTful APIs, JWT user authentication
Research & Data	MySql	Database resource curation & task structuring

The project seamlessly integrated a React frontend with a robust Java Spring Boot backend.

Current Status

SkillQuest currently features a functional prototype with a user-friendly frontend and a secure backend. Users can log in, view organized learning routes, and track their progress through curated task lists. The foundational architecture is complete, paving the way for adding more skills and advanced progress-tracking features in the future.
